

# Chat Room Project

# threading Module In Python

- ▶ **threading** module is used for creating, controlling and managing threads in python.

- ▶ **Thread class constructor**

```
Thread(group=None, target=None, name=None, args=(), kwargs={})
```

- ▶ **start() method**

- ▶ This method is used to start the thread's activity. When we call this method, internally the run() method is invoked which executes the target function or the callable object.

# Thread class constructor

- ▶ `group`: Should be `None`. It is reserved for future extension.
- ▶ **`target`**: This is the callable object or task to be invoked by the `run()` method(the function names )
- ▶ `name`: This is used to specify the thread name. By default, a unique name is generated following the format `Thread-N`, where `N` is a small decimal number.
- ▶ **`args`**: This is the argument tuple for the target invocation. We can provide values in it which can be used in the target method. It's default value is empty, i.e. `()`
- ▶ `kwargs`: This is keyword argument dictionary for the target invocation. This defaults to `{}`.

# Threading example

```
import time
import threading
def thread1(i):
    time.sleep(3)
    print('No. printed by Thread 1: %d' % i)
def thread2(i):
    print('No. printed by Thread 2: %d' % i)

if __name__ == '__main__':
    t1 = threading.Thread(target=thread1, args=(10,))
    t2 = threading.Thread(target=thread2, args=(12,))
    # start the threads
    t1.start()
    t2.start()
```

# LISTS IN PYTHON

- ▶ Lists - collections of data
- ▶ numbers = [10, 5, 7, 2, 1]
- ▶ **Adding elements to a list:**
  - ▶ `list.append(value)`
    - ▶ A new element may be *glued* to the end of the existing list
    - ▶ The list's length then increases by one.
  - ▶ The `insert()` method is a bit smarter - it can add a new element at any place in the list, not only at the end.
    - ▶ `list.insert(location, value)`

# Removing elements from a list

- ▶ **clear()**: Remove all items
- ▶ **pop()** : Remove an item by index and get its value
- ▶ **remove()**: Remove an item by value
- ▶ **Del**: Remove items by index or slice

# Making use of lists

```
▶ my_list = [10, 1, 8, 3, 5]
▶ total = 0
▶ for i in my_list:
▶     total += i
▶ print(total)
```

# Chat room project

- ▶ We need to create chat project , when any client send message this message will broad cast to all client
- ▶ The server should run thread for each client
- ▶ In client side receive and send will be in separate thread
- ▶ Nick name should be used for each client
- ▶

# Client

- ▶ Create socket object
- ▶ Connect to server
- ▶ Take the nick name from the user
- ▶ Receive function
- ▶ Write function
- ▶ Start thread for receive
- ▶ Start thread for write

# Client: Receive function

- ▶ **def receive():**
  - ▶ While true:
    - ▶ try:
      - ▶ #receive message from server
      - ▶ If message=='NICK':
        - ▶ Send the nick name to server
      - ▶ Else:
        - ▶ Print(message)
    - ▶ except:
      - ▶ Print receive error
      - ▶ Close connection
      - ▶ break

# Client Write function

- ▶ **def Write():**
  - ▶ While true:
    - ▶ try:
      - ▶ #read message from user
      - ▶ Message=nick name+message
      - ▶ Send message to server
    - ▶ except:
    - ▶ print write error

# Client Start thread for receive and write method

```
rec_Thread=threading.Thread(target=recv)  
rec_Thread.start()  
  
wr_Thread=threading.Thread(target=Write)  
wr_Thread.start()
```

# Server

- ▶ Create Socket object
- ▶ bind server to socket
- ▶ listen()
- ▶ Create list for clients and list for nicknames
- ▶ broadcast(message) function
- ▶ Handle(client) function
- ▶ Receive function
- ▶ Call receive function

# Server: broadcast(message)

- ▶ `def broadCast(message):`
- ▶ For each client in clients list
  - ▶ `Client.send(message)`

# Server: handle(client)

- ▶ While True:
  - ▶ Try:
    - ▶ `Msg=Client.recv(1024)`
    - ▶ `broadcast(msg. decode() )`
  - ▶ except:
    - ▶ Print handle error
    - ▶ Remove client from clients list
    - ▶ Remove nick name from nickNames list
    - ▶ `broadCast( (nickName+" Left chat room").encode())`
    - ▶ break

# Server: receive() function

- ▶ While True:
  - ▶ Cli,add =server.accept()
  - ▶ Send 'NICK' to client
  - ▶ Recive the nick name from client
  - ▶ Add cli to clients list and nickname to nicknames list
  - ▶ broadCast(nickName+' join the chat room')
  - ▶ #start thread for handle function
  - ▶ **thread=threading.Thread(target=handle,args=(cli,))**
  - ▶ **thread.start()**

# Task2

- ▶ Implement the chat room project

Thank You
